

Pedagogic case and specific course in which designed tasks and units are used

Name of university: UCM

Contact person: Adrián Riesco (ariesco@ucm.es)

Pedagogic case:	<ul style="list-style-type: none">• Teaching formal specification in rewriting logic• Teaching formal verification with Linear Temporal Logic via model checking.• The course is aimed to Master's students in Computer Science.
Description (including temporal scheme for design, development and implementation)	<ul style="list-style-type: none">• Rewriting logic is a logic of change, where transitions are described with rules. Verification in these systems is done by analyzing the corresponding automata generated by applying rules in a non-deterministic way.• The automata of these systems stands for the state space of many different games, so the idea is to introduce the system with simple games: inquire will be used in programming assignments for students.

Aim of pedagogic case	<ul style="list-style-type: none"> To reflect on how to use games to teach mathematical concepts to non-mathematicians.
Mathematical concepts	<ul style="list-style-type: none"> Rewriting logic. Linear Temporal Logic.
Addressed practice	<ul style="list-style-type: none"> Master's course on Computer Science. First semester
Place in specific course Course name Place of units	<ul style="list-style-type: none"> One semester course. Auditory and Quality Assurance. Unrelated with other subjects; the Master's course gives a wide description of several topics but details are explored in the Master's Thesis only.
Learners profile orientation, year, age, prior knowledge, other such as math anxiety, special needs, ..	<ul style="list-style-type: none"> Approximately 23 years old. Degree in Computer Science. Around 25 students.
Organisation of specific course study credits/hours, location, group size	<ul style="list-style-type: none"> 60 hours. 4 hours per week; 15 weeks. The case focuses on part of the subject, around 20 hours. Each week the teacher presents the concepts for 2 hours (Wednesday) and the students work under the supervision of the teacher for 2 hours (Friday).
Expected learning outcomes	<ul style="list-style-type: none"> Students are able to specify and verify simple but real systems.
Envisioned use of digital technology	<ul style="list-style-type: none"> Completely; students use Maude, a specification language, to code their assignments.
Planning of tasks	<ul style="list-style-type: none"> Discussion with other teachers involved in specification of systems. Related work - Maude book. Design of programming examples and assignments. Concepts and syntax are taught via games. First assignments are games as well; final assignments are a more complex version of these games. 1st assignment - Discussion in large groups (the whole class under the teacher supervision). 2nd and 3rd assignments - Discussion in small groups. 4th and 5th assignments - Discussion in groups of at most 2 students. Graded. Wednesdays are used to introduce new example and discuss those problems that students could not solve on Friday. Study how well theoretical ideas are coded.

	<ul style="list-style-type: none"> • Discussion of results.
Names of persons involved	<ul style="list-style-type: none"> • Adrián Riesco
Course:	Master Course in Computer Science
Learning objectives	<p>On completion of this module, students should be able to:</p> <p>Knowledge and Understanding</p> <ul style="list-style-type: none"> - Specify average transition systems. - Verify these systems. <p>Subject-specific Skills</p> <ul style="list-style-type: none"> - Equational and rewriting logic. - Model checking. <p>Transferable Skills</p> <ul style="list-style-type: none"> - graph theory; - declarative programming.
Learning contents	<ul style="list-style-type: none"> • Membership equational logic - Maude functional modules. • Rewriting logic - Maude system modules. • Modal logic. • Model checking - Maude MODEL-CHECKER module. • Partial order reduction.
teaching /learning activities	<ul style="list-style-type: none"> • Programming assignments. • Programming examples via games.
Media	<ul style="list-style-type: none"> • Maude
Evaluation	<ul style="list-style-type: none"> • Correctness of ideas. • Correctness of code.
Instructor role	<ul style="list-style-type: none"> • On Wednesday he/she presents the basic ideas and helps students with those problems they could not solve. • On Friday he/she first leads discussions. in large groups Then he/she helps in smaller groups.
Student roles	<ul style="list-style-type: none"> • Engage in assignments. In lectures they propose ideas but the teacher leads.
